~~Flashcards | Quizlet~~

The heart is a hollow, muscular organ that

Where To Download Human Heart Anatomy And Circulation Answer

pumps oxygenated blood throughout the body and deoxygenated blood to the lungs. This key circulatory system structure is comprised of four chambers. One chamber on the right receives blood with waste (from the body) and another chamber pumps it out toward the lungs where the waste is exhaled.

~~The Heart | Circulatory Anatomy — Visible Body~~

Chambers and Circulation through the Heart. The human heart consists of four chambers: The left side and the right side each have one atrium and one ventricle. Each of the upper chambers, the right atrium (plural = atria) and the left atrium, acts as a receiving chamber and contracts to push blood into the lower chambers, the right ventricle and the left ventricle.

the body) inferior and superior vena cava - pump blood from the body into the heart)

~~Human Heart: Anatomy and Circulation Flashcards | Quizlet~~

One of the primary functions of the human heart is to pump blood throughout the body. Blood delivers oxygen, hormones, glucose and other components to various parts of the body, including the human heart. There are two types of circulation within the body, namely pulmonary circulation and systemic circulation.

~~Learn How the Human Heart Works | Veative Labs - YouTube~~

The heart is a muscular organ about the size of a closed fist that functions as the body's circulatory pump. It takes in deoxygenated blood through the veins and delivers it to the lungs for oxygenation before pumping it into the various arteries (which provide oxygen and nutrients to body tissues by transporting the blood throughout the body).

~~Human Heart - Diagram and Anatomy of the Heart~~
